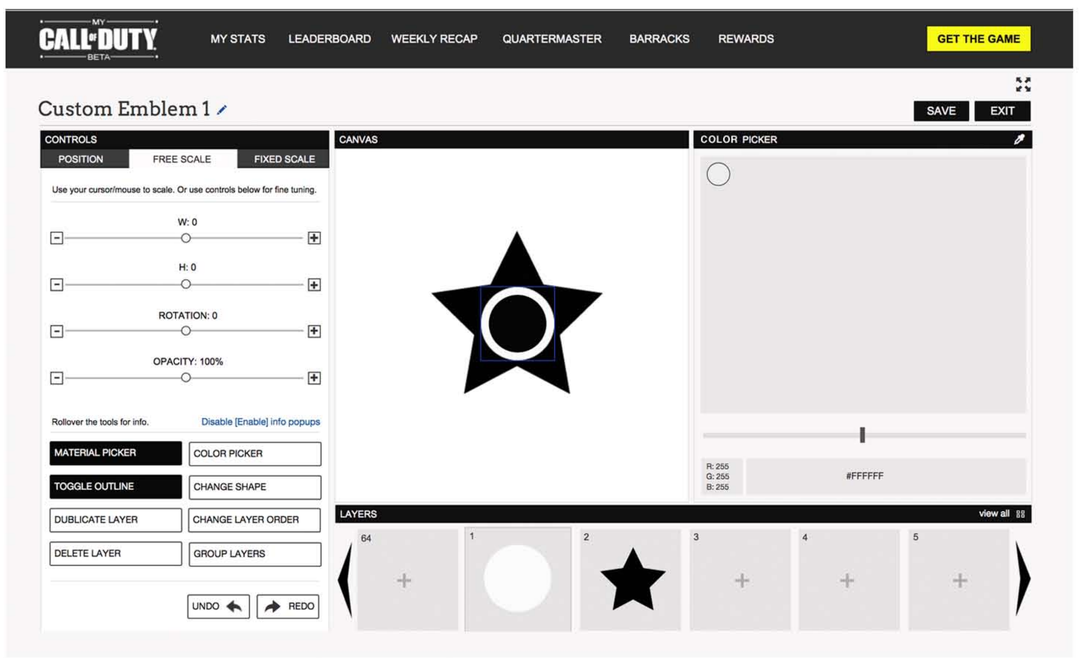
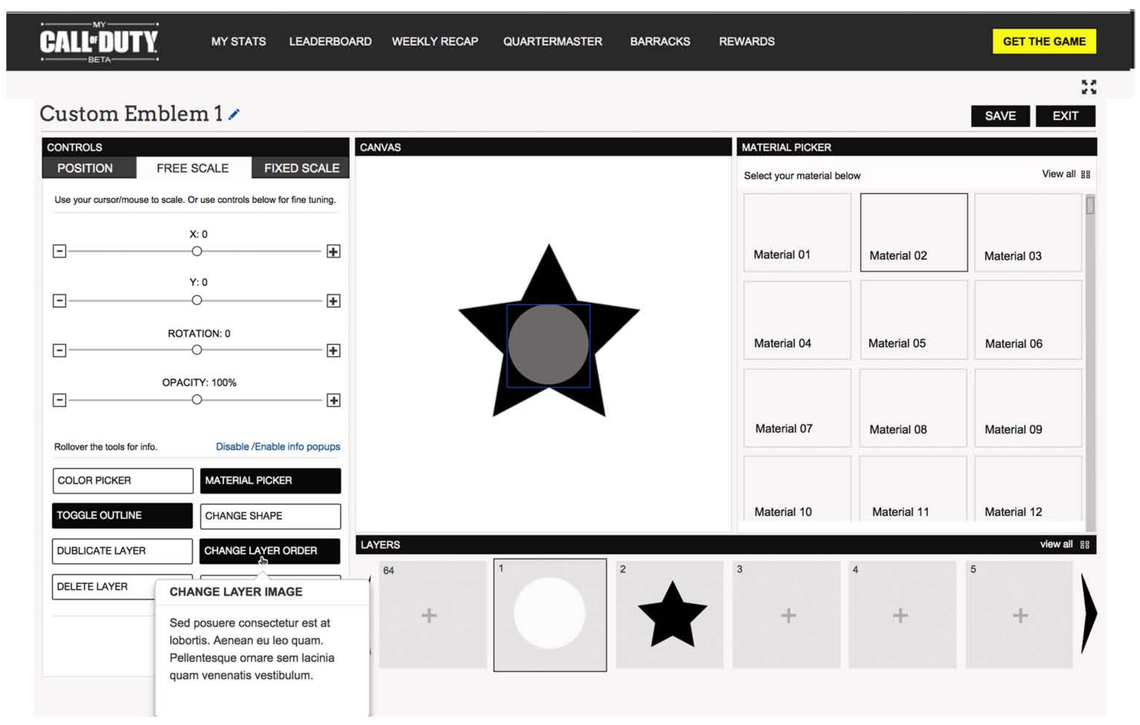
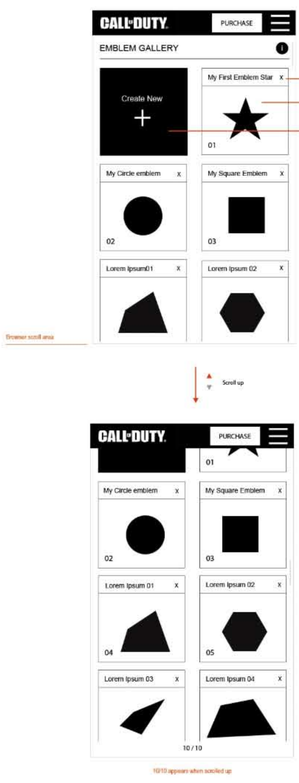
WEB VIEW I Wireframe Sample

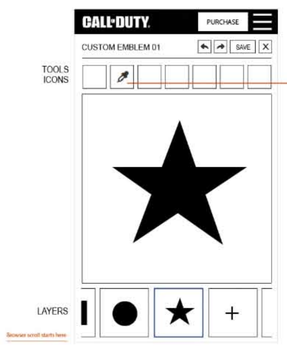


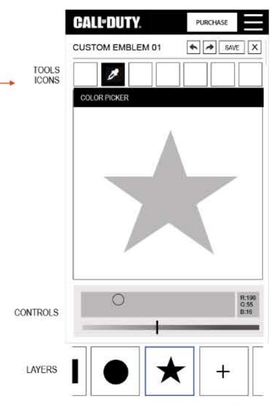
MATERIAL PICKER



MOBILE VIEW







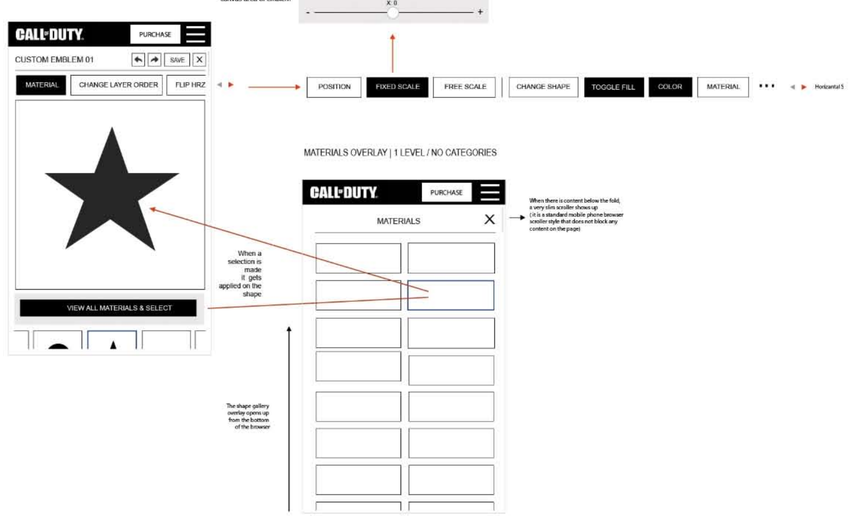
When there is content below the fold, a very slim scroller shows up (it is a standard mobile phone browser scroller style that does not block any content on the page)

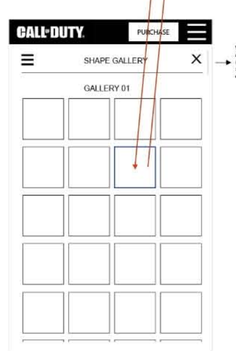
OR (HORIZANTALLY SCROLLABLE) TOOLS

Designer notes:

I am now leaning towards the use of this horizantally scrollable menu over the iconic onewhich is on the left. I can only make a decision after we create the set of icons for the tools, as the tool icons are important to keep consistent to the ones in the in-module editor as well. Also there is inconsistent tools such as freescale etc. "Toggle fill" tool is in the first level too.

Horizantally scrolling tool bar is a very common tool bar in use today for mobile tools/selections type of interactions, in this area the name of the tool and the icon would be good to use.





Once an image is selected it goes back to the emblem editor and the layer is filled with the selected image
